

How to use pandoc

Markdown to Beamer and more

What is Pandoc?

- Pandoc is a Haskell library for converting from one markup format to another, and a command-line tool that uses this library.

Example: Markdown to Beamer

(For MacOS)

- ❶ Install Pandoc.
- ❷ Write a markdown file like this, and save it as `test.md`.
- ❸ open terminal and run `$ pandoc -t beamer -o test.md presentation.pdf`
- ❹ Now you have the resulting `presentation.pdf` file.

Pandoc can also convert equations with `$inline$` and `$$displaymode$$`, like $e^{i\pi} + 1 = 0$ and

$$\sin^2 x + \cos^2 = 1.$$
